[1] Performance data according to ČSN EN 14 511, in accordance with the EHPA requirements for quality mark Q. A7W35 60 Hz - air 7 °C, water 35 °C, compressor frequency 60 Hz
[2] Recommended value of el. 3x400V fuse, incl. Auxiliary integrated electric boiler. The units 22I, 26I and 30I can also be connected to a 1x230V network with 40A"B"(22I), resp. 50A"B"(26I, 30I).
[3] Design power at outdoor temperature -10 ° C according to ČSN EN 14 825.

Options

- Internet HP control Master
- Full Cooling reversing
- Terminal pAD temperature compensation
- Terminal pADh floor cooling
- Expanded control module for PLUS version
- Evap. with Corrosion Resistant Coating (single fan)
- Evap. with Corrosion Resistant Coating (2 fans)
- External unit colour on demand RAL code
- Silver colour
- RAL 9006

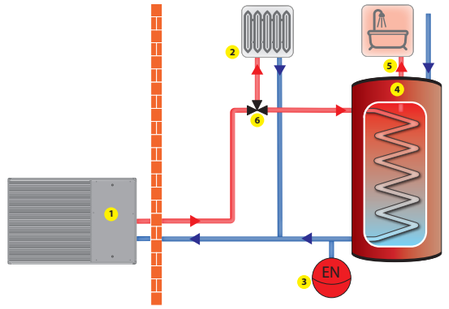
Standard equipment

- ✔ Graphic terminal PGD
- ✔ Variable output Inverter Compressor
- ✔ New low-noise fan
- ✔ Equitherm control system MaR
- ✔ Built-in immersion heater and circulation pump
- ✔ Electronically controlled coolant injection

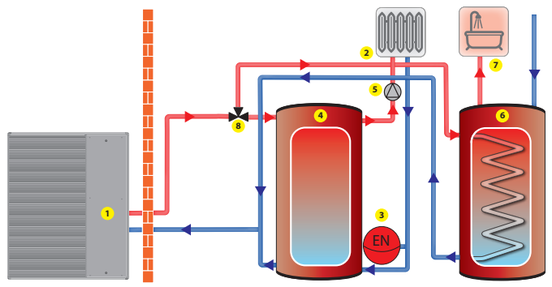
Features

- ▶ Outdoor compact
- ▶ Use for heating and cooling
- ▶ The temperature of heating water to 60 °C
- ▶ Temperatures range from +35 °C to -20 °C
- ▶ Very easy installation, quiet operation
- ▶ Control up to 6 heating circuits

Heat pump connected directly to the heating system with 3wv for domestic hot water (dhw) preparation.
1-heat pump, 2-heating system, 3-expansion vessel, 4-dhw tank with coil, 5-dhw outlet, 6-3way valve
The heat pump (1) is directly connected to heating system. Heating water temperature is controlled according to a weather compensation curve. Production of hot water is a priority over the heating system by switching the 3wv (6) to the dhw tank (4). The heat pump increases the outlet water temperature until the requested dhw temperature is achieved, once achieved the heat pump switches the 3wv back to heating operation. This type of system is ideally suited to underfloor heating systems (ufh) but also systems with radiators with a large volume of heating water utilising our pAD room terminal. This solution limits the possibility of local zone control (independent loop ufh, thermostatic valves on radiators).



Heat pump connected to a buffer tank and 3wv to the domestic hot water cylinder (dhw)
1-heat pump, 2-heating system, 3-expansion vessel, 4-buffer tank, 5-heating circulator pump, 6-dhw tank with coil, 7- dhw outlet, 8-3way valve
Heat pump (1) connected to the heating system through a buffer tank (4) which has the function of thermal buffer and a low loss header. Heating water temperature is controlled according to a weather compensation curve. The flow to the heating system is controlled by the main heating circulation pump. Production of hot water is a priority over the heating system by switching the 3wv (8) to the dhw tank (6). The heat pump increases the outlet water temperature until the requested dhw temperature is achieved, once achieved the heat pump switches the 3wv back to heating operation. This solution is ideally suited to systems with low heat buffering capacity and systems that require independent room zone control. Additionally, this type of system has the ability to integrate a secondary source of heat into the buffer tank (4) such as a wood stove with back boiler.



Dimensions and connections: BA30I and BA45I:

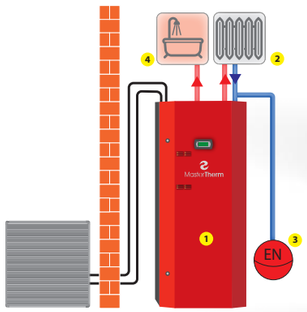
Heat pump connected directly to the heating system with in-built 170l dhw cylinder

1-heat pump, 2-heating system, 3-expansion vessel, 7-dhw outlet

The heat pump (1) is directly connected to heating system. Heating water temperature is controlled according to a weather compensation curve. Production of hot water is a priority over the heating system and is prepared via the internal cylinder. This type of system is ideally suited to underfloor heating systems (ufh) but also systems with radiators with a large volume of heating water utilising our pAD room terminal. This solution limits the possibility of local zone control (independent loop ufh, thermostatic valves on radiators).



Heat pump connected to a buffer tank with in-built 170l dhw cylinder

1-heat pump, 2-heating system, 3-expansion vessel, 4- buffer tank, 5- heating circulation pump, 7-dhw outlet

Heat pump (1) connected to the heating system through a buffer tank (4) which has the function of thermal buffer and a low loss header. Heating water temperature is controlled according to a weather compensation curve. The flow to the heating system is controlled by the main heating circulation pump. Production of hot water is a priority over the heating system and is prepared via the internal cylinder. This solution is ideally suited to systems with low heat buffering capacity and systems that require independent room zone control. Additionally, this type of system has the ability to integrate a secondary source of heat into the buffer tank (4) such as a wood stove with back boiler.

1) Performance data according to ČSN EN 14 511. B0W35 - antifreeze mixture 0 °C, water 35 °C.
2) Recommended value of el. 3x 400 V fuse as standard, without auxiliary electric boiler
3) Design power at outdoor temperature -10 °C according to ČSN EN 14 825.

Options

- Internet HP control Master
- Full Cooling reversing (for models: 22Z-90Z)
- Passive Cooling module (for models: 22Z-37Z)
- Terminal pAD temperature compensation
- Terminal pADh floor cooling
- Desuperheater
- Three phase relay
- Softstart
- AQ Electric heater 4,5 kW / 6,0 kW / 7,5 kW
- Expanded control module for PLUS version
- Refrigerant 134a high temperature
- Water to water version
- Internal unit (silver or red colour)

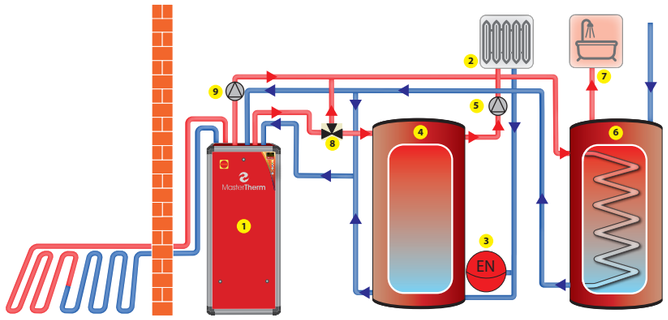
RAL 9006 | RAL 3020

Standard equipment

- ✔ Integrated graphic terminal PGD
- ✔ Electronically controlled coolant injection
- ✔ Equitherm control system MaR
- ✔ Built-in circulator pumps for primary and secondary circuits
- ✔ Main power supply switch

Features

- ▶ Use for heating and cooling
- ▶ The temperature of heating water to 60°C
- ▶ Quiet operation
- ▶ Control up to 6 heating circuits



Heat pump connected to a buffer tank and 3wv to the domestic hot water cylinder (dhw) with desuperheater.
1-heat pump, 2-heating system, 3-expansion vessel, 4-buffer tank, 5-heating circulation pump, 6-dhw tank with coil, 7- dhw outlet, 8-3way valve, 9-desuperheater circulation pump
Heat pump (1) connected to the heating system through a buffer tank (4) which has the function of thermal buffer and a low loss header. Heating water temperature is controlled according to a weather compensation curve. The flow to the heating system is controlled by the main heating circulation pump. Production of hot water is a priority over the heating system by switching the 3wv (8) to the dhw tank (6). The heat pump increases the outlet water temperature until the requested dhw temperature is achieved, once achieved the heat pump switches the 3wv back to heating operation. When dhw requested temperature is achieved the heat pump controller moves 3wv back to heating operation. The desuperheater (optional equipment) is a additional exchanger which harvests high potential energy from compressor outlet. An independent circuit with circulator pump (9) is used for high efficiency dhw preparation during heating mode.

[1] Performance data according to ČSN EN 14 511, in accordance with the EHPA requirements for quality mark Q. B0W35 60 Hz - antifreeze mixture 0 °C, water 35 °C, compressor frequency 60 Hz
[2] Recommended value of el. Safety in basic equipment, without auxiliary electric boiler
[3] Data for 90I at 90 Hz
[4] Design power at outdoor temperature -10 °C according to ČSN EN 14 825.

Options

- Internet HP control Master
- Full Cooling reversing
- Passive Cooling module (for models: 22I-45I)
- Terminal pAD temperature compensation
- Terminal pADh floor cooling
- Desuperheater
- AQ Electric heater 4,5 kW / 6,0 kW / 7,5 kW
- Expanded control module for PLUS version
- Water to water version
- Internal unit (silver or red colour)

RAL 9006 | RAL 3020

Standard equipment

- ✔ Integrated graphic terminal PGD
- ✔ Variable output Inverter Compressor
- ✔ Equitherm control system MaR
- ✔ Electronically controlled coolant injection
- ✔ Main power supply switch
- ✔ Built-in circulator pumps for primary and secondary circuits

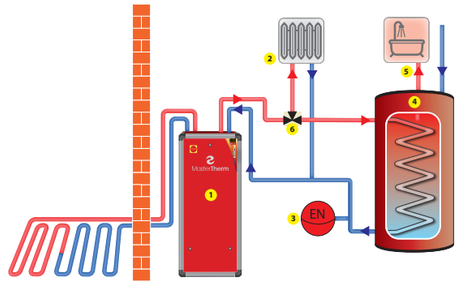
Features

- ▶ Use for heating and cooling
- ▶ Continuous control of heating power
- ▶ Brine pump speed control
- ▶ The temperature of heating water to 60 °C
- ▶ Water / water version on request
- ▶ Quiet operation, No buffer tank required
- ▶ Control up to 6 heating circuits

Heat pump connected directly to the heating system with 3wv for domestic hot water (dhw) preparation.

1-heat pump, 2-heating system, 3-expansion vessel, 4-dhw tank with coil, 5-dhw outlet, 6-3way valve

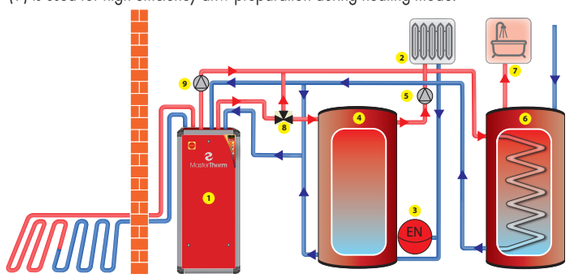
The heat pump (1) is directly connected to heating system. Heating water temperature is controlled according to a weather compensation curve. Production of hot water is a priority over the heating system by switching the 3wv (6) to the dhw tank (4). The heat pump increases the outlet water temperature until the requested dhw temperature is achieved, once achieved the heat pump switches the 3wv back to heating operation. This type of system is ideally suited to underfloor heating systems (ufh) but also systems with radiators with a large volume of heating water utilising our pAD room terminal. This solution limits the possibility of local zone control (independent loop ufh, thermostatic valves on radiators).



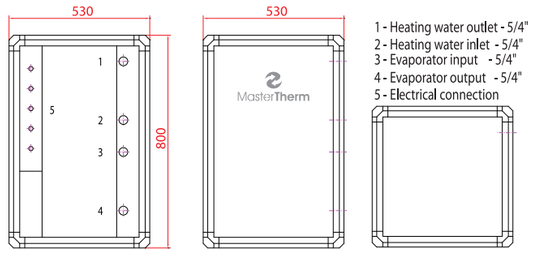
Heat pump connected to a buffer tank and 3wv to the domestic hot water cylinder (dhw) with desuperheater.

1-heat pump, 2-heating system, 3-expansion vessel, 4-buffer tank, 5-heating circulation pump, 6-dhw tank with coil, 7- dhw outlet, 8-3way valve, 9-desuperheater circulation pump

Heat pump (1) connected to the heating system through a buffer tank (4) which has the function of thermal buffer and a low loss header. Heating water temperature is controlled according to a weather compensation curve. The flow to the heating system is controlled by the main heating circulation pump. Production of hot water is a priority over the heating system by switching the 3wv (8) to the dhw tank (6). The heat pump increases the outlet water temperature until the requested dhw temperature is achieved, once achieved the heat pump switches the 3wv back to heating operation. When dhw requested temperature is achieved the heat pump controller moves 3wv back to heating operation. The desuperheater (optional equipment) is a additional exchanger which harvests high potential energy from compressor outlet. An independent circuit with circulator pump (9) is used for high efficiency dhw preparation during heating mode.



Dimensions and connections: AQ17I



1 - Heating water outlet - 5/4"
2 - Heating water inlet - 5/4"
3 - Evaporator input - 5/4"
4 - Evaporator output - 5/4"
5 - Electrical connection

[3] Design power at outdoor temperature -10 °C according to ČSN EN 14 825.

Options

- Internet HP control Master
- Passive Cooling module
- Terminal pAD temperature compensation
- Terminal pADh floor cooling
- Expanded control module for PLUS version
- Internal unit (silver or red colour)
  - RAL 9006
  - RAL 3020

Standard equipment

- ✔ Stainless steel tray with a capacity of 170 l with integrated solar exchanger
- ✔ Integrated graphic terminal PGD
- ✔ Special compressor with variable speed control
- ✔ Equitherm control system MaR
- ✔ Electronically controlled coolant injection
- ✔ Electric boiler 4,5 kW
- ✔ Main power supply switch

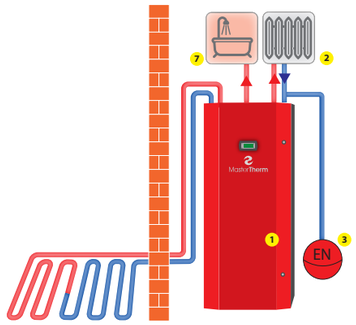
Features

- ▶ Use for heating and cooling
- ▶ Continuous control of heating power
- ▶ High efficiency hot water heating, heating water temperature up to 60 °C
- ▶ Heating system on 0,5 m²
- ▶ Quiet operation
- ▶ No buffer tank required
- ▶ Control up to 6 heating circuits

Heat pump connected directly to the heating system with in-built 170l dhw cylinder.

1-heat pump, 2-heating system, 3-expansion vesel, 7-dhw outlet

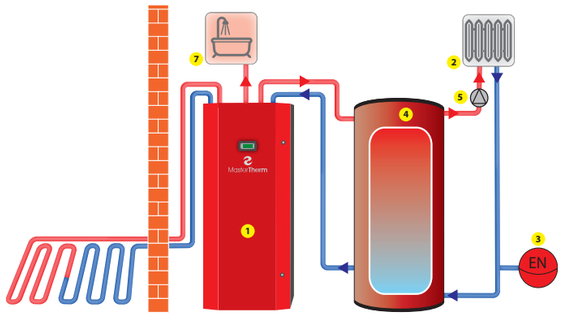
The heat pump (1) is directly connected to heating system. Heating water temperature is controlled according to a weather compensation curve. Production of hot water is a priority over the heating system and is prepared via the internal cylinder. This type of system is ideally suited to underfloor heating systems (ufh) but also systems with radiators with a large volume of heating water utilising our pAD room terminal. This solution limits the possibility of local zone control (independent loop ufh, thermostatic valves on radiators).



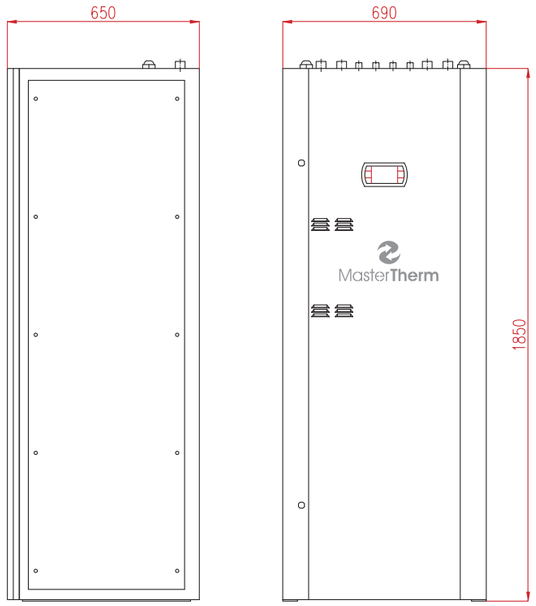
Heat pump connected to a buffer tank with in-built 170l dhw cylinder .

1-heat pump, 2-heating system, 3-expansion vessel, 4- buffer tank, 5- heating circulation pump, 7-dhw outlet

Heat pump (1) connected to the heating system through a buffer tank (4) which has the function of thermal buffer and a low loss header. Heating water temperature is controlled according to a weather compensation curve. The flow to the heating system is controlled by the main heating circulation pump. Production of hot water is a priority over the heating system and is prepared via the internal cylinder. This solution is ideally suited to systems with low heat buffering capacity and systems that require independent room zone control. Additionally, this type of system has the ability to integrate a secondary source of heat into the buffer tank (4) such as a wood stove with back boiler.



Dimensions and connections:



1 - Water / Mix Input
2 - Water / Mix Output
3 - Heating water outlet
4 - Heating water inlet

Options

- Internet HP control Master
- Full Cooling reversing
- Terminal pAD temperature compensation
- Terminal pADh floor cooling
- Expanded control module
- Cascade control Master Lan
- Communication protocol ModBUS RTU
- Internal unit (silver or red colour)
- External unit (silver)
- External unit colour on demand RAL code

for models EM60Z, EM75Z and BA60IS:

- Ext.electric heater 7,5+7,5 kW
- Ext.electric heater 12+18 kW
- Desuperheater
- Modification to IndoorSplit

Standard equipment

- ✔ Electric boiler 6+6 kW (for model BA60I and BA75Z)
- ✔ Integrated graphic terminal PGD
- ✔ Electronically controlled coolant injection
- ✔ Equitherm control system MaR
- ✔ New low-noise fan
- ✔ Built-in circulator pumps for primary and secondary circuits
- ✔ Main power supply switch

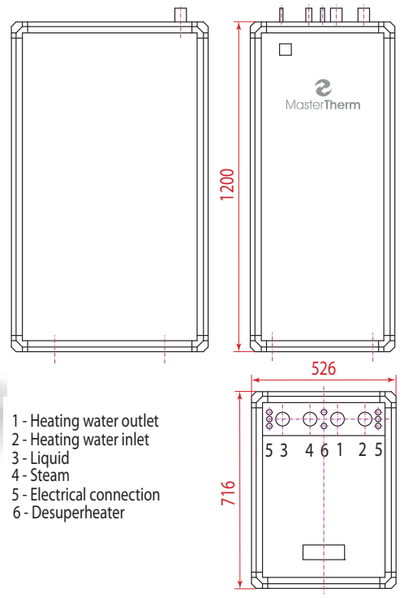
Features

- ▶ Use for heating and cooling
- ▶ The temperature of heating water to 55 °C (64 °C)
- ▶ Temperatures range from +40 °C do -20 °C
- ▶ Very easy installation, quiet operation
- ▶ Control up to 6 heating circuits

BA60IS, EM60Z-75Z (split)

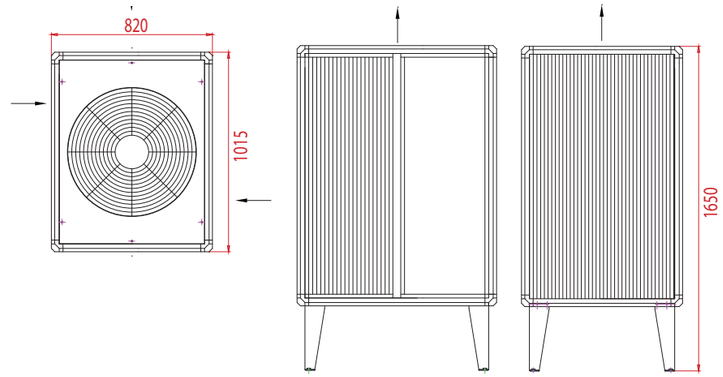
BA60I, BA75Z (compact)

Internal unit BA60IS, EM60Z and EM75Z:

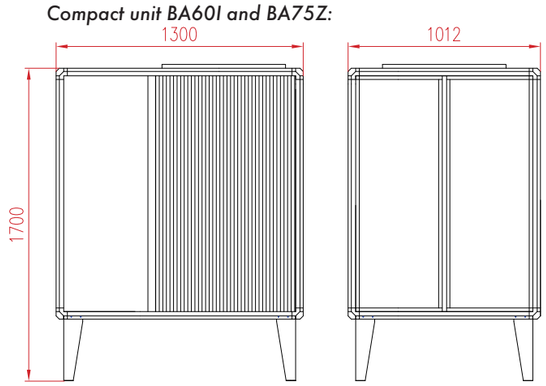


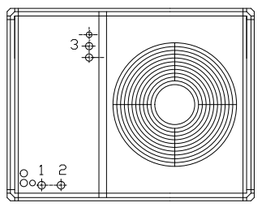
1 - Heating water outlet
2 - Heating water inlet
3 - Liquid
4 - Steam
5 - Electrical connection
6 - Desuperheater

External unit BA60IS, EM60Z and EM75Z:



Compact unit BA60I and BA75Z:





1 - Heating water outlet
2 - Heating water inlet
3 - Electrical connection

European Quality Label for Heat Pumps

ehpa

STROJÍRENSKÝ ZKUŠEBNÍ ÚSTAV • CERTIFIKOVÁNO •

Why MasterTherm

1 Tradition - since 1994

- traditional and largest Czech producer
- more than 10,000 heat pumps sold in more than 20 European countries
- in-house research, development and production

2 Innovation for future

- progressive electronic coolant injection technologies (EEV)
- inverter compressors, "desuperheater" for heating of hot water
- active and passive cooling
- control and monitoring via the internet
- application for iOS and Android

Download app from the App Store or Google Play (Android Market).
Enter the following information in the Connection tab. Name: demo | *Password:* mt-demo

3 Durability of design

- high reliability and long lifespan thanks to the robust and practical design
- components from renowned suppliers: Copeland, LG, Sanyo, Carel, SWEP, Lloyd, Ziehl-Abegg, EBM Papst, Halm etc.
- decreased operational stress: superior design of exchangers, high quality regulation and protection system

4 System solutions

- designed and equipped as a heating system, not merely as a heat source
- regulation allows for control of spatial heat in individual zones
- everything needed is included in the price of the equipment,
- simple and reliable installation

5 Seriousness

- truthful and complete information
- responsible approach to customers
- long-term company strategy based on quality of services
